

(a) each robot's candidate set starts from one cubic B-spline $C_i(u) = \sum_m P_{i,m} B_{m,3}(u)$

(b) z3 proposes $(c_0, c_1) = (0, 0)$; the oracle refutes it and the clause $\neg x_{0,0} \vee \neg x_{1,0}$ is learned

(c) the core blames $\{0, 1\}$ at ξ ; 3 of 19 control points move by $\eta \mathbf{n}$ — the rest of the curve is bit-identical

(d) verified plan: both robots swing, 473 steps = 47.3 s, 0 resamples
